

VOR STREAM

Make smarter decisions, faster.

VOR Stream is risk intelligence that shifts the balance from waiting for results to acting on them.

After decades of delivering risk solutions to financial heavyweights we at FRG know the conventional truths of the business:

- It takes a long time to get results
- Data volume is ever growing
- Models are getting more and more complex
- Old platforms have you locked in on hardware, software, and resource profiles
- It is increasingly difficult to run and maintain legacy systems
- There is neither budget nor time to start over with something new

In other words, your current system is adding to your risk instead of measuring and mitigating it.

That is why we created VOR Stream.

”

VOR Stream is a next-generation risk engine that should be the new standard for financial institutions. VOR Stream comes preconfigured with feature-rich waterways, accelerating time to value, but is also flexible and configurable to any bank's unique needs.

Andrew Markners, TD Bank

Features

VOR Stream is intelligently scaled to fit each problem you give it. It can break down your risk processes to the molecular level. Every ounce of processing power earns its keep. It runs your risk processes smarter and therefore faster. We're talking minutes, not hours or nights.

VOR Stream is cloud ready and is designed to also support on-premise installations. You choose the deployment that fits your business model. With FRG you can choose from fully-hosted to on-premise deployment.

VOR Stream lets you watch the trailer before the movie. After all, it is a streaming service. Using advanced machine learning algorithms, it shows you early results and gives you the (remote) control to pause, resume, stop, restart, and go back and forth in your risk processing.

VOR Stream speaks your language. It has hooks, plugs, and pre-built APIs to connect your risk models, however they are articulated.

VOR Stream adapts to you. It has an open-source architecture that evolves at the pace of your growth and progress.

VOR Stream sets a low bar of entry. It can process data and run models as they are. It lets you upgrade your risk processing on your time and budget. But if you need a head start, FRG can help.

VOR Stream is for everyone. Users can leverage the command line interface or the web-based UI to consume waterways in their own and shared playpens.

VOR Stream gives you the wheel, so you don't have to reinvent it. FRG has solved many of the industry risk problems, allowing you to leverage our pre-built waterways. Use one of our waterways out of the box or as a starting point for something tailor-made for your business. You're welcome.
